	Foreword	xi
	Preface	xv
	Acknowledgments	xix
	List of notation	xx
	List of units	xxxiv
	List of common and scientific names	xxxvi
1	Introduction and overview	1
A	Introduction	1
B	Overview	2
Part I	Biophysics	
2	Canopy structure	17
A	Introduction	17
B	Stand structure	17
C	Crown shape	18
D	Solid density	20
E	Leaf orientation	23
F	Leaf type	34
3	Radiant fluxes	37
A	Introduction	37
B	Definitions	39
C	Partition of radiance	44
D	Nominal average insolation over the growing season	49
E	Length of growing season	52
F	Penetration of direct radiation into the canopy	56
G	Penetration of diffuse radiation into the canopy	66
H	Penetration of total radiation into the canopy	67
I	Optical optimality	71
J	Structural response to the radiation regime	76

4	Turbulent fluxes	80
A	Background	80
B	Introduction to momentum flux	82
C	General formulation of momentum flux	85
D	Features of momentum flux in homogeneous canopies	91
E	Momentum flux in homogeneous leafy canopies: $M = 1$	102
F	Momentum flux in homogeneous stemmy canopies	108
G	Momentum flux in non-homogeneous leafy canopies: $M = 1$	113
H	Drag partition	124
I	Eddy viscosity for open canopies: $M \ll 1$	127
J	Flux of mass and of sensible heat	127
K	Evaporation from a saturated surface	130
L	The equivalent atmospheric resistance	133
M	Transpiration from saturated stomatal surfaces	134
N	Transpiration from a dry leaf surface	137
O	Transpiration from a dry forest canopy	139
5	Thermal energy balance	146
A	Definitions and assumptions	146
B	Evaporation in state space	149
C	Bounds to the Bowen ratio	156
D	Transpiration	157
E	The canopy-atmosphere temperature difference	165
F	Relevance to nutrient and carbon flux	169
6	Water balance	170
A	Introduction	170
B	Model framework	172
C	Precipitation	174
D	Storm infiltration and surface runoff	176
E	Potential (unstressed) transpiration	180
F	Bare soil evaporation	182
G	Moisture-constrained transpiration	186
H	Percolation and capillary rise	188
I	Evaporation from surface retention	189
J	The mean annual (or seasonal) water balance	190
K	The vegetation state-space	191
L	The critical moisture state	195
M	Conclusions	206

Part II Darwinian ecology

7	Optimal canopy conductance	209
A	Compensation light intensity	209
B	The resistance ratio for closed canopies: $M = 1$	212
C	The resistance ratio for open canopies: $M \ll 1$	226
D	The resistance ratio for intermediate canopy cover	228
E	The canopy state variables: cover and conductance	230
8	Optimal bioclimate	234
A	Photosynthesis	235
B	Photosynthetic capacity of an isolated leaf	242
C	Light control of productivity of an isolated leaf	245
D	Water control of productivity of an isolated leaf	253
E	Joint control of leaf productivity by light and water	262
F	Bioclimatic optimality for the canopy-average leaf	266
9	Natural habitats and climax communities	275
A	Review of habitat constraints	275
B	Proposition no. 1: Heat	276
C	Proposition no. 2: Light	279
D	Proposition no. 3: Water	284
E	Conclusion	293
10	Net primary productivity and ecotones	294
A	Canopy biomass production	294
B	Ecotones	316
11	Summary, speculations, and opportunities	321
A	Summary	321
B	Speculations	325
C	Opportunities	327
Appendices		
A	Effect of crown shape on flow in canopy	329
B	Estimation of potential evaporation from wet simple surfaces	346
C	Water balance equations	356
D	Characterization of exponential decay	363
E	Transpiration as a productivity surrogate	365

F	Climatology of station storm rainfall in the U.S.: Parameters of the Poisson rectangular pulses model	370
G	Derivation of the G-function	393
H	The canopy absorption index and compensation ratio as species constants	396
	Glossary	399
	References	409
	Author index	429
	Subject index	434
